**SASS IRIS LIST  
1945**

**MAPLE ROAD GARDENS**  
**JACOB SASS**  
RFD 1 BENSON STA. OMAHA, 4, NEBR.

**FOREWORD**

Our iris are mostly of variegata origin. This is a hardy strain, as the home of the variegata is Hungary, where climatic conditions are similar to eastern Nebraska and Iowa. So they are adapted to the larger parts of the United States but are not reliable in warmer regions, with little or no frost, where they often fail to bloom, or bloom on very short stems. The reason is, that the variegatas are waiting for winter to appear and as they usually start growth late, they will be caught by the heat.

The variegata is also responsible for all the colors in iris, with the exception of blue, and it is only natural that most breeders are using this strain in breeding for new varieties with new colors. Size and height has been added by infusion of blood from Macrantha and Trojana.

Plant iris in a sunny location that has good drainage. The bulb or rhizome should be planted just under the surface, not too deep. The roots should be spread out and the soil packed around them.

The best time to plant iris is in July and August, although they can be transplanted at any time of the year when the ground is not frozen.
